Debugging note taking application

❖ Initially the code does not run ,due to method not allowed error,So i added get request along with post in methods.

❖ To get information from the form 'post' request I changed its from '.args' to '.form'.

❖ Also changed in the html form method='post' and action='index'.

❖ To run the the code if the request.method ='Post' now the application did run on the web browser.

❖ Now on input text field it takes empty input and even spaces as input.

❖ To remove it I used string.strip(' ') method and, run if the length of string!=0

❖ Now everything is working fine.It is able to take notes and give it in the form of list.

❖ Now when i open it in the another browser the same notes are appeared in there as well

❖ As Mr.Kanav Bansal sir told to use sessions to resolve it during the class .so i learnt it from w3school & tutorialspoint web site understood that they store the information on client side in the form of dictionaries and it will be stored in the present web browser only ,where we are using it.

❖ lastly as we refresh the browser it re-submitting its previous value present in it and resolved it using redirect(url_for()) on the same route

❖ finally added few css styling to the front_end page

THANKYOU
